                 -i- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).
-i- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
-i- TISSUE SPECIFICITY: Forms the fibrils of tendon, liquments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                . .) Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-3. This is a tetramer of human recombinant gelatin-like protein Hu-1 ADM48390. A claimed composition suitable as a substitute for protein Hu-1 ADM48390. A claimed composition suitable as a substitute for protein Hu-1 ADM48390. A claimed substitue a protein having a colloid cosmocite function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 Kba and at most 50 Kba and an composition of a less than 8. It is especially Hu-1 or Hu-deam composition of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or clearance rate from blood circulation, provides better and predictable corregulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-correct of the proteins that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 780
pharmaceutically active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the interstitum. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of exythrocytes, thrombocytes and leukocytes, immune responses, and blood levels of messenger molecules such as

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-1 ADM48390. A claimed composition suitable as a substitute for plasma composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid osmotic function. The protein is a recombinant gelatin-like protein with a colloid osmotic function. The protein is a recombinant gelatin-like protein with a combinant gelatin-like protein, or a dimer, trimer or tetramer of the recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin-like proteins that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically cative compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the intersitium. Clearance by cliver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotthing vasodilation, function of environment and leukocytes, immune responses, and blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGERGERGEQGPAGSPGFQGLPGPA 180

```
culture support comprises the step of coating a microcarrier bead with comprises the protein having a molecular weight of about 40-
200 kba, and optionally further comprising the step of immobilising the comprete than 75%, preferably more than 85% and more preferably more than 95% of the gelatine-like protein on the microcarrier. In this process, contemplatine or gelatine-like protein has the same molecular weight. Contemplatine or gelatine-like protein is recombinantly produced to obtain a material of uniform molecular weight and to reduce the risk of contamination with prions. A claimed cell support consists of microbeads of 50.500 um size coated with a gelatine-like protein consisting of at least 95% Gly-xaa-yaa triplets and containing at least 15% proline residues and less than 5% of hydroxyproline residues, with a molecular weight distribution showing a maximum between 40 and 200 kpa, at least 75% of the protein molecules having a molecular weight within 2% of the maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers.
                                                                                                                                                                                                                                                                           / Match 75.0%; Score 3482; DB 8; L Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gelatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of human recombinant gelatin-like polypeptide Hu-3, which has a molecular weight of approximately 54 kba and which contains multiple Gly-Xaa-Yaa triplets. In an example from the invention, recombinant Hu-3 was immobilised on polystyrene beads using a heterobifunctional crosslinking agent, and used in a spinner flask cell culture. A claimed process for the preparation of a cell
                                                                                                                                                                                                                                                                   480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is porcine alphal(I) collagen. The present invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, bone grafts, drug delivery system, dermal implants, haemostats, and incontinence implants and for treating autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as sausage casings, and in cosmetics or facial and skin products such as sausage moisturisers. Recombinant gelatin is useful in vaccine formulations for treating viral infections, autoimmune diseases and cancer. Galatin is medical devices and products, in food and beverage industries, in hair medical devices and products, as a glue or adhesive in various manufacturing processes, as a light-sensitive costing in various and parterial partitive costing in various and elementary in the medical hase in which the care products, as a light sensitive costing in various

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                      The present sequence represents a human type 1 (alphal) collagen protein of 3.4-deahdro-L-prolline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting the area of a least one 3.4-dehydroprolline residue in the polypeptide with an epoxydation reacted from a polypeptide containing at least one 3.4-dehydroprolline residue ontaining at least one 3.4-dehydroprolline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadhesives), and for incorporating a wide variety of groups, including therapeutic ligands and biological probes,

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily depreciated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell, incorporating the nucleic acid sequence into the cell, and contacting the incorporating the nucleic acid sequence into the cell, and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated incorporated into the extracellular matrix protein. The content of mathod may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinagen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proteins which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen I (alphal)/decorin protein, which may be produced using the method of the invention

```
incorporating the nucleic acid sequence into the cell; and contacting the selected from the growth medium containing at least one amino acid, hydroxyproline and and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The hydroxyproline into proteins. This is especially useful in the hydroxyproline into proteins. This is especially useful in the ecombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The proteins depends on the post translational hydroxylation of proline. The polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents collagen 1 (alphal)/transforming sprott in translational hydroxylation of proline. The present sequence represents collagen 1 (alphal)/transforming sprott factor-betal (TGF-betal) protein, which may be produced using the marked is a two translation of proline may be produced using the

The invention relates to the production of mammalian collagen in plants. 2 clones: alpha3 and alpha22, spanning the human collagen type I gene were isolated from a NG-63 osteosarcoma library. Clone alpha3 contained 83 bp of the 5' untranslated region and the first 1920 bp of coding sequence, whereas clone alpha22 contained sequence encoding amino acids 

in and New recombinant nucleic acid for expressing collagen or derivatives plants - useful as, e.g. bio-materials and in therapeutic, cosmetic Merot B; Garrone R, Comte J, ſĽ, Ruggiero plants - useful as, e.g. bi odontological compositions. Disclosure; Fig 7; 138pp; French.

თ

The 2 clones were used to generate a number of fragments which were used to construct composite sequences encoding variant collagen molecules. The fragments are: (A) containing nucleotides (nt) -4 to 479; (B) containing proteins are to expensive the sequence encoding the PRS (pathogenesis-related TAA upstream of the sequence encoding the PRS (pathogenesis-related CC TAA upstream of the sequence encoding the PRS (pathogenesis-related the protein of Dases 66-77 from the sequence encoding the CC TAA upstream of the pro-collagen amino propeptide domain; (C) the whole of the amino propeptide domain (nt 72-479); (D) all of the amino-telopeptide commin (nt 474-534) and the N-terminus of the Helicoidal region (nt 535-1920); (E) the DraIII-Bamil fragment (1709-2808) of alpha22, encoding as 56-1936 of the central helicoidal domain; (G) the C-terminus of the C-terminus of and as 1193-1454 in the C-propeptide domain; (G) the C-terminus of the C-terminus of an 1343-140 and also including the NDEL motified and and (G).

CC propeptide domain (as 1346-1464) plus stop codons, and (H) as G but the BR. This sequence represents a recombinant human collagen. The encoding an 1343-140 and also including the NDEL motified (F) and (G).

CC propeptide compresses or prometation in the C-terminus of the C-terminus gene is used for expression of mammalian collagen. The encombinant gene is used for expression of mammalian collagen. The plant cells. The transformed plants, their extracts and parts are useful as blomaterials (medical, odontological, cosmetic and parts are useful compositions (e.g. as prostheses for cardiac valves, ligaments or tendons; skin substitutes; gingival implants; microcapsules for nettines; guide trubes for netters are related provent factors anticance antical and parts are surgical trubes; for netters surgical through and also an antical and parts are surgical trubes. Secured and parts are surgical encoding and an analysism and an analysism and an antical and and an analysism and an antical and and an antical and an growth factors, anticancer agents or anti-inflammatories; surgical thread and components of ointments). They are suitable for treating any disorder related to collagen dysfunction and gelatin, produced from collagen, is used to produce glues, surgical prostheses and foods 888888888888888888888888888888888

                                                                                                                                                                                                                                                                                                                                                                    8
claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a fit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates an enthod for identifying a compound useful in treating computed to a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more construction or pain and a sequence presented for preparing a medicament for treating computes its sequence presented is a human proceed or the compound that compute or spain (e.g. spainal segmental nerve injury (CUIN and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human proceed (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed specification, but was obtained an electronic form directly from WIPO at the wibo. Int. Vnh. Vnullished not, securing form directly from WIPO at

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal. Claim 1; Page; 1017pp; English.

that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating or pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (Ct) and spared nerve injury (SNI)) in an animal (e.g. gene the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed frp.wipo.int/pub/published\_pct\_sequences. %XGGGGGGGGGGGGGGGGGGGGGGG

More particularly, the method relates these polypeptides stimulating mesenchymal cell growth and/or division and to transfecting these cells and chondrocytes with vectors carrying the genes of these polypeptides capable of stimulating chondrogenesis, osteogenesis, growth, repair, regeneration and/or restoration of the extracellular matrix. The chondrocytes selectively express genes required to form a cartilaginous matrix. The DACC polypeptides and polymodeotides are useful for identifying an agent that modulates the activity of the polypeptide, for stimulating mesenchymal cell growth and/or division by exposing animal mesenchymal cells to conditioned media or its active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   growth,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 13
```

growth and/or division by inserting into an animal cell, a compound which inhibits the translation of the polymelectide encoding the DACC. The method and the polypeptides are useful for stimulating mesenchymal cell growth and/or division or for stimulating chondrogenesis, cartilage, or connective tissue growth, repair, regeneration and/or restoration in an animal. The polymelectides, polypeptides, agonists and antagonists may be used in treatment modalities, specifically in gene therapy. The polypeptides can be used as bait proteins in a two- or three-hybrid assay to identify other proteins, which bind to or interact with the polypeptide and are involved in modulating cell growth and/or division. The sequences presented in ABG93923-ABG93948 are the proteins encoded by the DACC cDNA clones 

Sequence 1461 AA;

the invention relates to polymucleotides encoding novel human proteins or their active domains. The polypeptides, polymucleotides and antibodies caused against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides can be used to identify compounds which bind to the polypeptides. Polymucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in generating the encompinant proteins, and in generating anti-sense DNA or RNA and in generating the encompinant proteins of the invention can be used to target drugs to antibodies/elicit an immune response, to determine quantitative protein levels as tissue markers, and to isolate receptors or ligands.

Tolypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, segenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting 1075 devdakdepadepoderdendendendentkonrorsdiodepedergergerscasden 1135 in gene 771 immunomodulatory, cytostatic, neuroprotective, vulnerary, nootropic, anticonvulsant, antiarthritic, cerebroprotective, antifungal, antiviral, antibacterial, antiallergic, dermatological, haemostatic, antiasthmatic, thrombolytic, immunogen, antibody, gene therapy; neurological disorder; parkinson's disease, inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder. The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-6 hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of protein, which may be produced using the method of the invention

Sequence 21, Application US/09331347C
Patent No. 6617431
GENERAL INFORMATION:
APPLICANT: Meristem Therapeutics, S.A.
TITLE OF INVENTION: Recombinant Collagens and Derived Proteins Produced by Plants, N. TITLE OF INVENTION: Recombinant Collagens and Their Uses
TITLE OF INVENTION: Detailing Such and Their Uses
CURRENT APPLICATION NUMBER: US/09/331,347C
CURRENT APPLICATION NUMBER: US/09/331,347C
CURRENT FILING DATE: 1999-08-17
NUMBER OF SEQ ID NOS: 22
SOFTWARE: Patentin version 3.1
Language 1.6.4
Language 2.6.4
Language 2.6

Sequence 18, Application US/09500811

Patent No. 632314

GENERAL INFORMATION:
APPLICANT: Qvist, Per
APPLICANT: Bonde, Martin
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out the
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out the
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
TITLE OF INVENTION: Disorders Associated with the Metabolism of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATTORNEY/AGENT INFORMATION:
NAME: ROWLAND, Bertram I.
REGISTRATION NUMBER: 20,015
REFERENCE/DOCKET NUMBER: A55556-3/BIR
TELECOMMUNICATION INFORMATION:
                                                                                                                                                                                                                                                                         Sequence 62, Application US/08642255
Patent No. 577349
GENERAL INFORMATION:
APPLICANT: CARPELLO, Joseph
APPLICANT: FERRARI, Franco A.
TITLE OF INVENTION: High Molecular Weigh
TITLE OF INVENTION: Protein Polymers
NUMBER OF SEQUENCES: 135
                                                                                                                                                                            GPPGEAGKPGEQGVPGDLGAPGPSGPAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TELEPHONE: (415) 494-8700
